22204 7590 04/02/2007 NIXON PEABODY, LLP 401 9TH STREET, NW SUITE 900 WASHINGTON, DC 20004-2128			EXAMINER WONG, XAVIER S	
			ART UNIT	PAPER NUMBER
			2609	
SHORTENED STATUTORY PERIOD OF RESPONSE		MAIL DATE	DELIVERY MODE	
3 MONTHS		04/02/2007	PAPER	

Please find below and/or attached an Office communication concerning this application or proceeding.

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

<b>Office Action Summary</b>	Application No. 10/698,449	Applicant(s) KAWAGOE ET AL.	
	Examiner Xavier Wong	Art Unit 2609	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 3<sup>rd</sup> November 2003.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1 - 11 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1 - 11 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 3<sup>rd</sup> November 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All    b) ☐ Some \*    c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

Art Unit: 2609

## DETAILED ACTION

### *Priority*

Acknowledgment is made of applicant's claim for foreign priority under 35 U.S.C. 119(a)-(d).

### *Information Disclosure Statement*

The information disclosure statement submitted on 3<sup>rd</sup> November 2003 has been considered by the Examiner and made of record in the application file.

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this

Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 2 and 4 – 8 are rejected under 35 U.S.C. 102(b) as being anticipated by Yoneda et al (U.S Patent 5,726,942).

Consider claim 1, Yoneda et al clearly show and disclose an encoder (as an arbiter circuit) that comprises: a timing circuit 60 that sends variation of output signals to show a timing at which a flag data in a prefetch circuit 16 is shifted to a flag register 18 (col. 25 lines 39-46; figs. 10-11); prioritizing means are

Art Unit: 2609

accomplished by a priority sub-block encoder (priority circuit) that assigns signals as mismatch ("0" as in invalid/lower priorities) or hit ("1" as in valid/highest priority) in which only a first priority address matches even though a plurality of matching signal candidates exist as afterwards the signals will be detected by a flag data sense circuit 126 (col. 4 lines 5-13, col. 11 lines 42-47 & col. 53 lines 42-46; figs. 1-2). When priority flag/hit data moves to another priority sub-block, the flag data goes through a priority encode cycle (delay) in which the contents of the flag register 18 are switched over to the second priority flag data held in the prefetch circuit after the last hit signal in the flag data in the first priority sub-block held in the flag register is reset; therefore, producing a time/delay during which no encode output can be performed (col. 22 lines 7-15).

Consider claim 2, and as applied to claim 1 above, **Yoneda et al** clearly show and disclose a priority flag data goes through a priority encode cycle (delay) in which the contents of the flag register 18 are switched over to the second priority flag data held in the prefetch circuit (holding means) after the last hit signal in the flag data in the first priority sub-block held in the flag register is reset; therefore, a time/delay during which no encode output can be performed – between holding and prioritizing stages (col. 22 lines 7-15).

Consider claim 4, and as applied to claim 1 above, **Yoneda et al** clearly show and disclose a timing circuit 60 that sends variation of output signals to show a timing at which a flag data in a prefetch circuit 16 is shifted to a flag

Art Unit: 2609

register 18 in which the flag data held is being encoded with a predetermined priority (col. 25 lines 39-51; figs. 10-11).

Consider claim 5, and as applied to claim 1 above, **Yoneda et al** clearly show and disclose hit flag data are predetermined into first and second priorities and so on as non-first priority data are held in a prefetch register and wait (delay) until their priority comes/the last signal to be output (col. 21 lines 46-67 & col. 22 lines 1-15; *abstract*). Therefore, this procedure implies that each output signal is prioritized and delayed.

Consider claim 6, and as applied to claim 1 above, **Yoneda et al** clearly show and disclose when priority flag/hit ("1" – highest priority) data moves to another priority sub-block, the flag data goes through a priority encode cycle (delay) in which the contents of the flag register 18 are switched over to the second priority flag data held in the prefetch circuit after the last hit signal in the flag data in the first priority sub-block held in the flag register is reset; therefore, producing a time/delay during which no encode output can be performed (col. 22 lines 7-15).

Consider claim 7, and as applied to claim 1 above, **Yoneda et al** clearly show and disclose the timing control circuit, which is a flip-flop circuit as shown in *figure 23* as D-latch modules 16 and 18, detects flag data (high/hit signals), held in the flag register 18, applies a switch timing signal or initial value setting signal (as

Art Unit: 2609

a trigger signal) to the flag register 18 and feeds the flag data in the prefetch circuit 16 to the flag register (col. 21 lines 46-57; fig. 23). A reset signal is also linked to the flag register 18 through an AND gate 88 and OR gate 114 (col. 28 lines 29-43; fig. 23).

Consider claim 8, and as applied to claim 1 above, **Yoneda et al** clearly show and disclose priority sub-block encoder – for prioritizing means – gate components AND gate 88, OR gate 114, D-Latches (with gate circuits inside) that hold flag signals, as well as PMOS and NMOS gates (col. 9 lines 4-5; fig. 23).

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Art Unit: 2609

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims **3** and **9 – 11** rejected under 35 U.S.C. 103(a) as being unpatentable over **Yoneda et al (U.S Patent 5,726,942)** in view of **Okabayashi et al (JP 1993-259900)**.

Consider claim **3**, and as applied to claim **2** above, **Yoneda et al** clearly show and disclose a priority sub-block encoder (priority circuit) that assigns signals as mismatch ("0" as in invalid/lower priorities) or hit ("1" as in valid/highest priority) in which only a first priority address matches even though a plurality of matching signal candidates exist as priority flag/hit data moves to a second/lower priority sub-block (col. 4 lines 5-13 & col. 11 lines 42-47; figs. 1-2). The hit signal data in the second/lower priority sub-block latch-held in the prefetch circuit is shifted to each corresponding circuit of the data latch circuit **18** and held therein;

Art Unit: 2609

and therefore, the transmission of signals are delayed for lower prioritized signals (col. 12 lines 60-63).

However, **Yoneda et al** did not specifically disclose a plurality of stages of inverter circuits connected in series for the delaying means.

In a related field of endeavor, **Okabayashi et al** disclose a circuit comprising an even number of conduction resistor controlled CMOS inverters (in a plurality) connected in series (*abstract*; paragraph 0031; fig. 1 modules 41-44 & block 2).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to incorporate the teachings of a plurality of delay inverter circuits connected in series as taught by **Okabayashi et al**, in the circuit of **Yoneda et al**, for the purpose of creating delay during phase modulation to detect for potential deviations in output signals.

Consider claim 9, and as applied to claim 1 above, **Yoneda et al** clearly show and disclose the delaying and prioritizing means as well as a timing control circuit with a reset signal and a signal that passes through inverter 84 into a logic AND gate 88 (AND gate takes the *product* of two inputs); obviously for enabling/disabling the delay operations (col. 28 lines 29-43; fig. 23).

However, **Yoneda et al** did not specifically mention the delay inverter circuits connected in series comprise PMOS transistors, resistors and NMOS transistors.

Art Unit: 2609

In a related field of endeavor, **Okabayashi et al** disclose a circuit employing an even number of conduction resistor controlled CMOS inverters, which comprise of PMOS and NMOS transistors, connected in series (*abstract*; paragraph 0031; fig. 1 modules 41-44 & block 2).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to incorporate the teachings of a delay inverter circuits connected in series comprise PMOS transistors, resistors and NMOS transistors as taught by **Okabayashi et al**, in the circuit of **Yoneda et al**, for the purpose of creating delay during phase modulation to detect for potential deviations in output signals.

Consider claim 10, and as applied to claim 1 above, **Yoneda et al** clearly show and disclose a timing circuit 60 (acting as a delay circuit) that sends variation of output signals to show a timing at which a flag data in a prefetch circuit 16 is shifted to a flag register 18 in which the flag data held is being encoded with a predetermined priority (col. 25 lines 39-51; figs. 10-11).

However, **Yoneda et al** did not specifically disclose the delay circuit having an even number of stages of delay inverter circuits connected in series, the delay inverter circuits comprising PMOS transistors, resistors and NMOS transistors.

In a related field of endeavor, **Okabayashi et al** disclose a circuit employing an even number of conduction resistor controlled CMOS inverters,

Art Unit: 2609

which comprise of PMOS and NMOS transistors (well-known in the art), connected in series (*abstract*; paragraph 0031; fig. 1 modules 41-44 & block 2).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to incorporate the teachings of a delay inverter circuits connected in series comprise PMOS transistors, resistors and NMOS transistors as taught by **Okabayashi et al**, in the circuit of **Yoneda et al**, for the purpose of creating delay during phase modulation to detect for potential deviations in output signals.

Consider claim 11, and as applied to claim 10 above, **Yoneda et al** clearly show and disclose the delaying means of the claimed invention and the timing control circuit that comprises a reset signal and a signal that passes through inverter 84 into a logic AND gate 88 (AND gate takes the *product* of two inputs) and then the product signal passes through a logic OR gate 114 with the initial value setting signal; obviously for enabling/disabling the delay operations (col. 28 lines 29-43; fig. 23).

However, **Yoneda et al** did not specifically disclose a plurality of delay circuits each having an even number of stages of delay inverter circuits connected in series, the delay inverter circuits comprising PMOS transistors, resistors and NMOS transistors.

In a related field of endeavor, **Okabayashi et al** disclose a circuit comprising an even number of conduction resistor controlled CMOS inverters (in

Art Unit: 2609

a plurality), which comprise of PMOS and NMOS transistors, connected in series (*abstract*; paragraph 0031; fig. 1 modules 41-44 & block 2).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to incorporate the teachings of a plurality of delay inverter circuits connected in series comprise PMOS transistors, resistors and NMOS transistors as taught by **Okabayashi et al**, in the circuit of **Yoneda et al**, for the purpose of creating delay during phase modulation to detect for potential deviations in output signals.

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

A.) **Lazar et al (U.S Pub 2003/0231540 A1)** mention an arbitration and control system for row and column addressing with delay and refresh control functionalities implemented.

B.) **Proebsting (U.S Patent 5,343,090)** mentions a four-inverter delay circuit; however, as the inventor disclose, that any even number of inverters can be used.

C.) **Maruyama (U.S Patent 5,808,956)** mentions the replacing of a "resistor and capacitor" delay circuit by an even number of series-connected CMOS inverter circuits along with fuses.
